SERINE PROTEASE INHIBITORS

This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body.

The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase, thrombin, plasmin, kallikrein, Complement C1, acrosomal protease, lysosomal protease, cocoonase, α -lytic protease, protease A, protease B, serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa.

The serine proteases have been investigated extensively over a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. It is well known that these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical cellular processes, such as adhesion, migration, free radical production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

- 5 Thus for example an inhibitor of Factor Xa has value as a therapeutic agent as an anticoagulant, e.g. in the treatment and prevention of thrombotic disorders. The use of a Factor Xa inhibitor as an anticoagulant is desirable in view of the selectivity of its effect. Many clinically approved
- 10 anticoagulants have been associated with adverse events owing to the non-specific nature of their effects on the coagulation cascade.

- Also, there are well-known associations of $\alpha 1$ protease inhibitor deficiency with emphysema and cirrhosis and C1
- 15 esterase inhibitor deficiency with angioedema.

- It has now been found that certain aromatic compounds carrying bulky lipophilic side chains are particularly effective as inhibitors of serine proteases, especially proteases with negatively charged P1 specificity pockets, and
- 20 most especially the serine proteases thrombin, and most importantly Factor Xa. The Factor Xa inhibitors of this invention are potentially useful for the prophylaxis or treatment of thrombotic disorders such as amongst others venous thrombosis, pulmonary embolism, arterial thrombosis,
- 25 myocardial ischaemia, myocardial infarction, and cerebral thrombosis. They potentially have benefit in the treatment of acute vessel closure associated with thrombolytic therapy and restenosis, e.g. after transluminal coronary angioplasty or bypass grafting of the coronary or peripheral arteries and in
- 30 the maintenance of vascular access patency in long term hemodialysis patients.

Factor Xa inhibitors of this invention may, with benefit, form part of a combination therapy with an anticoagulant with a different mode of action or with a thrombolytic agent.

It has been reported in WO99/11658 and WO99/11657 that certain benzamidine and aminoisoquinoline derivatives carrying a bulky lipophilic side chain are excellent inhibitors of serine proteases. Unfortunately, it has since been found that 5 benzamidine compounds of WO 99/11658 in general demonstrate poor oral bioavailability.

Surprisingly, it has now been found that certain other aromatic compounds also show inhibitory activity against serine proteases, in particular Factor Xa, despite the lack of 10 the amidino or 1-aminoisoquinoline functionality previously believed to be crucial for activity as a factor Xa inhibitor. Many of these compounds also possess other structural features that further distinguish them from the compounds of WO99/11658 and WO99/11657.

15 Where compounds of the invention have been tested, they have generally demonstrated superior oral bioavailability in comparison with benzamidines disclosed in WO 99/11658. Also, it has been found that the compounds of the invention perform excellently in the prothrombin time assay (PT) when compared 20 to aminoisoquinolines of similar factor Xa activity and structure. The PT assay is a coagulation assay and it is widely accepted that direct acting Factor Xa inhibitors which perform well in the PT assay are more likely to be good antithrombotics.

25 In WO99/09053 certain 2-aminobenzamide compounds are disclosed as potential motilin receptor antagonists and in US 3268513 similar 2-aminobenzamide compounds are suggested as potential antibacterial agents. However, the novel compounds of the present invention have not before been suggested as 30 potential serine protease inhibitors.

Thus viewed from one aspect the invention provides a serine protease inhibitor of formula (I):

Preferably, R₂ is selected from one of the formulae (A') to (H'):

wherein X_4 is O or S, R_{13} is selected from hydrogen, fluoro, chloro or methyl and R_{14} is selected from hydrogen, methyl, ethyl, fluoro, chloro, and methoxy and R_{15} is selected from hydrogen, methyl, fluoro, chloro and amino.

- 5 More preferably, R_2 is of the formula (A') (wherein R_{14} is selected from hydrogen, methyl, ethyl, fluoro, chloro, and methoxy and R_{15} is selected from hydrogen, methyl, fluoro, chloro and amino) or of the formula (B') (wherein R_{13} is chloro) or of the formula (C') (wherein R_{13} is selected from
- 10 hydrogen, methyl and chloro) or of the formula (D') (wherein R_{13} is selected from hydrogen, methyl, fluoro and chloro) or of the formula (E') (wherein R_{13} is hydrogen) or of the formula (G') (wherein R_{13} is chloro).

Yet more preferably, R_2 is 4-methoxyphenyl, 3-amino-4-chlorophenyl, indol-2-yl, 5-chloroindol-2-yl, indol-6-yl, 3-chloroindol-6-yl or 3-methylindol-6-yl.

Yet more preferably, R_2 is of the formula (A') and R_{14} and R_{15} are as defined hereinabove.

Most preferably, R_2 is of the formula (A') and R_{14} is methoxy and R_{15} is hydrogen.

A preferred compound of the present invention is of the formula:

10

wherein Cy, R_2 and R_8 are as hereinabove defined and L is CONH, CH_2NHCO , $CONHCH_2$, $CONHCH_2CH_2$ or $CON(Me)CH_2$.

The compounds of the invention may be prepared by conventional chemical synthetic routes or by routes as illustrated by the following examples. They may be prepared by forming the -X-X- bond from appropriate intermediates such as reacting together compounds of the formula $Z_2-Y(Cy)-L-Lp(D)_n$ and R_2-Z_3 (wherein Z_2 is HX or a reactive functional group and Z_3 is HX or a reactive functional group). For example, when -X-X- is -CONH- or -CO-NR_{1a}-, by reacting a compound of the formula (10): $H_2N-Y(Cy)-L-Lp(D)_n$ with a compound of the formula R_2-COOH , under conditions known for the formation of an amide bond. The reaction is conveniently carried out in the presence of a benzotriazole-based reagent such as 1-hydroxybenzotriazole or 1-hydroxy-7-azabenzotriazole, in an inert organic solvent such as dimethylformamide and/or methylene chloride. The reaction mixture is usually taken to 0°C and then a dehydrating agent such as dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-

ethylcarbodiimide added. For example see coupling methods A and B described hereinbelow. Alternatively, a compound of the formula (10) may be reacted with a compound of the formula R_2COCl using similar methods to those described in coupling method C. For example, an acid of formula R_2COOH may be converted into an acid halide, such as an acid chloride, and then reacted with the compound of formula (10) in the presence of a base, such as pyridine. Another reagent is diethyl cyanophosphonate.

- 10 Compounds wherein -X-X- is -NHCO- or -NHCH₂- may be formed from the appropriate intermediates using reaction conditions for the formation of an amide bond as described above and if necessary subsequent reduction of the resulting amide bond.
- 15 Compounds of the formula (I) wherein -X-X- is of the formula -CH₂NH- may be prepared by reducing the corresponding compound of the formula (I) wherein -X-X- is -CONH-, or by reaction of a compound of formula (10):

- 20 with a compound of formula R_2CHO and reducing the intermediate of formula (I) where X-X is -C=N- with, for example, sodium cyanoborohydride.

When -X-X- is -CH=CH-, the compounds of the formula (I) may be prepared using the Wittig or Horner-Emmons reactions.

- 25 The corresponding compound in which -X-X- is -CH₂CH₂- can be formed by reduction of the -CH=CH- group, for example with hydrogen over a palladium-on-carbon catalyst.

- An -X-X- bond of the formula -COO- or -OC(O)- may be formed by reacting the appropriate hydroxy and activated carboxylic acid (e.g. acid chloride or reactive ester) intermediates under conditions known for ester bond formation.

Alternatively, a hydroxy and a carboxylic acid intermediate could be reacted together in the presence of diethylazodicarboxylate/triphenylphosphine.

An -X-X- bond of the formula -CH₂O- or -OCH₂- may be formed by reacting the appropriate hydroxy intermediate with the appropriate alkyl halide in the presence of a base. Conditions for the formation of an ether bond are known in the art.

These reactions can also be used to form intermediates, which contain one of the above -X-X- bonds.

Compounds of the formula (I) may also be prepared by forming the L linking groups. When L is of the formula -CON(R)(CH₂)_z- wherein R is hydrogen or methyl and z is 0, 1 or 2, the compound of formula I may be prepared by reacting a compound of the formula (11):

with a compound of the formula HN(R)(CH₂)_z-Lp(D)_n under conditions suitable for amide-bond formation. For example, those of coupling methods A and B described hereinbelow. Alternatively, the corresponding acid chloride of a compound of the formula (11) could be reacted with a compound of formula HN(R)(CH₂)_z-Lp(D)_n (wherein z is 0, 1 or 2 and R is hydrogen or methyl) using the similar coupling conditions to those described in coupling method C hereinbelow.

When L is of the formula -CH₂NHCO-, the compound of formula I may be prepared by reacting a compound of the formula (11'):

with a compound of the formula HOOC-Lp(D)_n under conditions suitable for amide-bond formation. For example, those of coupling methods A and B described hereinbelow. Alternatively, a compound of formula ClC(O)-Lp(D)_n could be reacted with a compound of formula (11') using the similar coupling conditions to those described in coupling method C hereinbelow.

Reactive groups in Lp(D)_n, which could cause side-reactions can of course be protected.

Intermediates which already contain the L linking group may be prepared from the appropriate carboxy compound using similar reaction conditions to those described above.

Compounds of the formula (I) can also be prepared by
5 reacting a compound of the formula (12):

with the appropriate aldehyde or ketone and a reducing agent, such as sodium cyanoborohydride or sodium
10 triacetoxyborohydride. The reaction between the compound of formula (13) and the appropriate aldehyde or ketone is carried out using the methods described in Alkylating Methods A and B described hereinbelow or methods similar thereto.

Intermediates containing the $L_p(D)_n$ group can also be
15 formed using these reactions from appropriate intermediates, although normally the introduction of the $-(L_a)_s-(G)_t-(L_b)_u-R_{10}$ group is the last step in the synthesis.

Alternatively, when L is of the formula $-\text{CONHCH}_2-$ compounds of the formula I may be prepared using the Ugi
20 reaction. For example, by reacting together compounds of the formula CyCHO , PGNH_2 , R_2COOH and

using the conditions, or similar, described in Component
25 Coupling method A, which is described in relation to the preparation of intermediates for Examples 64 to 76 below. Usually this method is used to prepare intermediates of the formula:

wherein PG' is a protecting group.

Hence the present invention also provides a process for the preparation of a compound of formula (I) comprising:

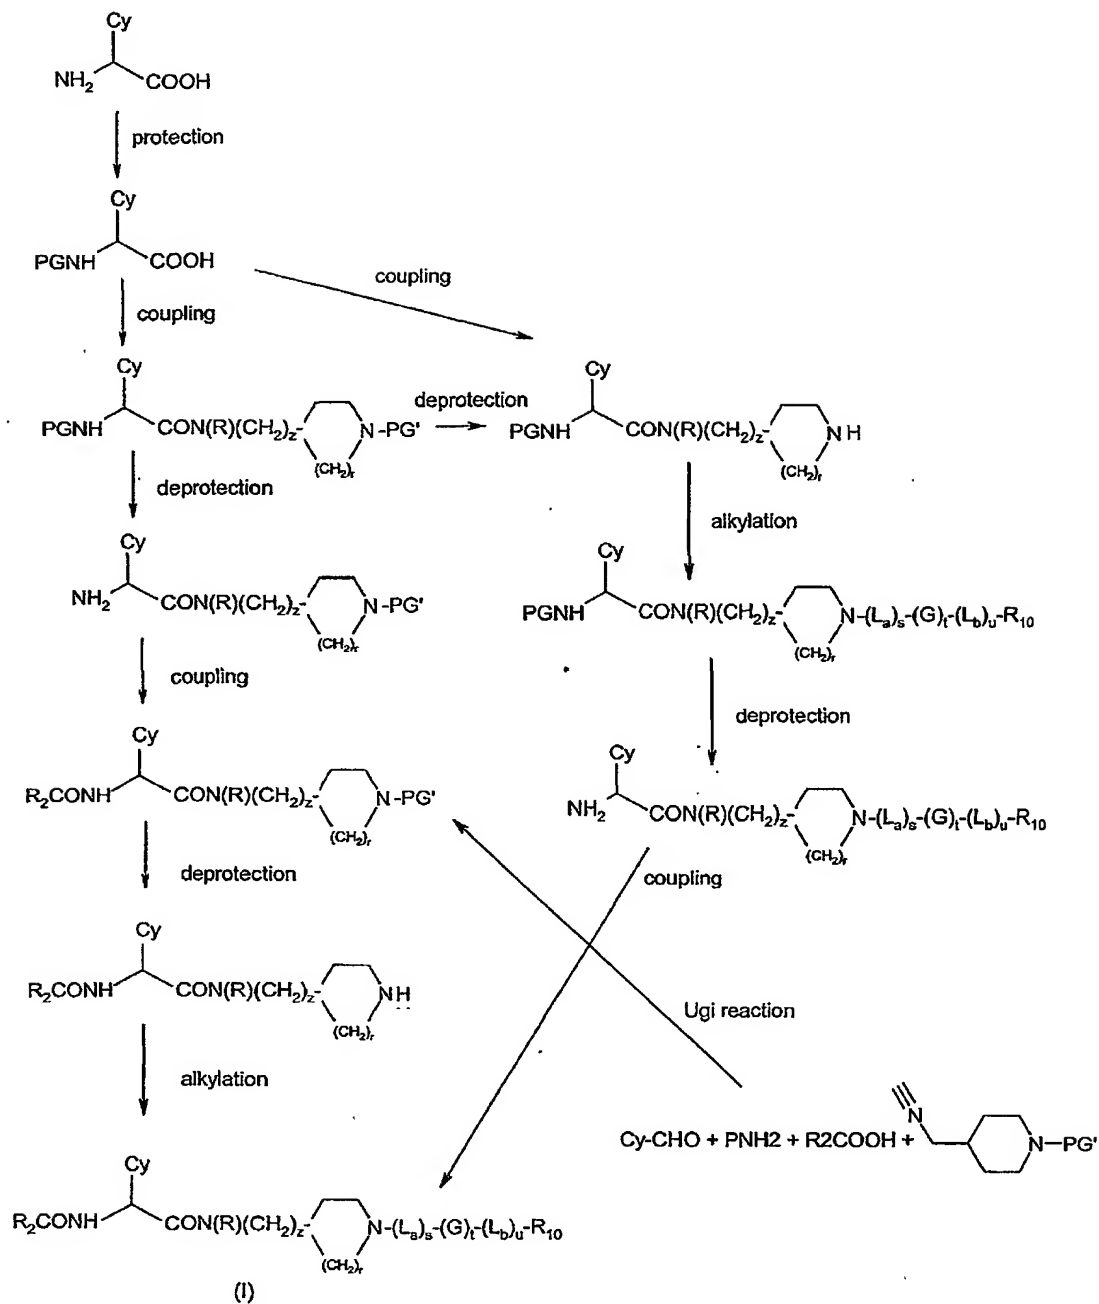

- 5 a) when -X-X- is -CONH- or -CONR_{1a}-, reacting a compound of formula (10) with a compound of formula R₂-COOH or R₂-COCl, under amide bond-forming conditions;
- b) when -L- is -CON(R)(CH₂)_z-, reacting a compound of formula (11) with a compound of formula HN(R)(CH₂)_z-Lp(D)_n
- 10 under amide bond-forming conditions;
- c) when -L- is -CH₂NHCO-, reacting a compound of formula (11') with a compound of formula HOOC-Lp(D)_n under amide bond-forming conditions; or
- d) reacting a compound of formula (12) with a the
- 15 appropriate aldehyde or ketone using alkylation reaction conditions;

wherein z, R, R₂ and Lp(D)_n are as hereinabove defined and formulae (10), (11) and (12) are as hereinabove defined, followed if a salt is required, by forming a physiologically

20 tolerable salt.

When -X-X is CONH, L is -CON(R)(CH₂)_z- and Y is CH, a compound of formula (I) may be prepared by a number of steps from an amino acid derivative using the reactions described above. For example, see Scheme 1.

Scheme 1

PG is an amino protecting group such as benzyloxycarbonyl
 PG' is an amino protecting group such as tert-butoxycarbonyl
 P is an amino protecting group such as 2,4-dimethoxybenzyl

When -X-X is CONH, L is $-\text{CH}_2\text{NHCO}-$ and Y is CH, a compound of formula (I) may be prepared by a number of steps from an amino acid derivative using the reactions described above. For example, see Scheme 2.

Scheme 2

An amino acid compound from Schemes 1 and 2 may be

prepared (for example) by one or more of the following methods:

- (i) from aryl or heteroaryl aldehydes via the Strecker synthesis or modifications thereof, via Bucherer-Bergs hydantoin synthesis, or via the Ugi methodology ("Isonitrile Chemistry", Ugi I. Ed.; Academic: New York, 1971;145-1999, "Multicomponent Reactions with Isocyanides", Domling, A.; Ugi, I. *Angew. Chem. Int. Ed.* 2000, 39, 3168; "Amino Acid Derivatives by Multicomponent Reactions", Dyker, G. *Angew. Chem. Int. Ed. Engl.* 1997, 36, 1700; and also see "A new Class of Convertible Isocyanides in the Ugi Four-Component Reaction", Lindhorst, T.; Bock H.; Ugi, I. *Tetrahedron*, 1999, 55, 7411.) with removal and replacement of protecting groups;

(vii) from oximes of formula

in which Pg is a carboxy protecting group, by reduction.

- 5 (Oximes in which Cy is a heteroaryl group may be prepared from compounds of formula

Alternatively, oximes may be prepared by nitrosation of a compound of formula Cy-CH₂-COOPg, or by reaction of

- 10 hydroxylamine with a compound of formula Cy-CO-COOPg), or any other method known in the art.

A starting material for the preparation of a compound of formula (I), where the alpha atom is nitrogen, may be produced, for example, by reaction of a beta protected

- 15 hydrazine (such protection to be chosen as to be compatible with the subsequent reagents to be employed) with phosgene, diphosgene, triphosgene or N,N'-carbonyl

diimidazole to give a reactive compound of the type

PGNHN(Cy)COCl or PGNHN(Cy)CO-imidazole (wherein PG is a

- 20 protecting group).

This intermediate may be used as has been described above for the carboxylic starting reagents where the alpha atom is carbon.

The skilled person will be aware that at certain stages

- 25 in the synthesis of a compound of formula (I) it may be necessary to protect a reactive functional group in the

molecule to prevent unwanted side-reactions.

The protection of amino and carboxylic acid groups is described in McOmie, Protecting Groups in Organic Chemistry, Plenum Press, NY, 1973, and Greene and Wuts, Protecting Groups in Organic Synthesis, 2nd. Ed., John Wiley & Sons, NY, 1991. Examples of carboxy protecting groups include C₁-C₆ alkyl groups such as methyl, ethyl, t-butyl and t-amyl; aryl(C₁-C₄)alkyl groups such as benzyl, 4-nitrobenzyl, 4-methoxybenzyl, 3,4-dimethoxybenzyl, 2,4-dimethoxybenzyl, 2,4,6-trimethoxybenzyl, 2,4,6-trimethylbenzyl, benzhydryl and trityl; silyl groups such as trimethylsilyl and t-butyldimethylsilyl; and allyl groups such as allyl and 1-(trimethylsilylmethyl)prop-1-en-3-yl.

Examples of amine protecting groups (PG) include acyl groups, such as groups of formula RCO in which R represents C₁-6 alkyl, C₃-10 cycloalkyl, phenyl C₁-6 alkyl, phenyl, C₁-6 alkoxy, phenyl C₁-6 alkoxy, or a C₃-10 cycloalkoxy, wherein a phenyl group may be optionally substituted, for example by one or two of halogen, C₁-C₄ alkyl and C₁-C₄ alkoxy.

Preferred amino protecting groups include benzyloxycarbonyl (CBz), t-butoxycarbonyl (Boc) and benzyl.

In another aspect the invention relates to a process for preparing a compound of formula I comprising deprotecting a compound of formula (I'):

Wherein R^{2'} is R² (as hereinabove defined) or protected R², Cy' is Cy (as hereinabove defined) or protected Cy and Lp(D)_n' is Lp(D)_n (as hereinabove defined) or protected Lp(D)_n; providing at least one protecting group is present.

If necessary physiologically tolerable salts can be formed using methods known in the art.

It will be understood that the compounds of formula (I)

may be isolated in the form of salts or solvates (which may or may not be physiologically tolerable), and that all such salts and solvates are therefore included within the scope of the

All novel intermediates described herein are provided as

10 administered in any convenient administrative form, e.g. tablets, powders, capsules, solutions, dispersions, suspensions, syrups, sprays, suppositories, gels, emulsions, patches etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g. diluents,
15 carriers, pH modifiers, sweeteners, bulking agents, and further active agents. Preferably the compositions will be sterile and in a solution or suspension form suitable for injection or infusion. Such compositions form a further aspect of the invention.

General Experimental Procedures:**Purification of Compounds (rpHPLC Method 1):**

Material is or was purified using standard reverse-phase preparative chromatography techniques. A 5 micron, 20 x 50 mm 5 O.D. C18 column was used (YMC ODS-A) with a flow rate of 20 mL/min and an standard elution time of 10-15 minutes. A gradient of water:acetonitrile (between 95:5 to 5:95; each eluent containing 0.1% TFA) over the elution time was used. Fractions containing product are or were concentrated, frozen, 10 and lyophilized to afford, when applicable, the trifluoroacetate salt of the product. The free base is or could be obtained, if desired, by loading a methanolic solution of the trifluoroacetate salt onto an ion-exchange resin (SCX, Varian) and subsequent elution of the resin with 15 methanol followed by 2 N ammonia in methanol. Concentration of the later fractions affords or afforded the free base product. Preparation of a hydrochloride salt from the free base is or was completed by treatment an organic solution of the free base (EtOAC, methylene chloride) with anhydrous HCl 20 in diethyl ether and concentration.

A solution of silyl thiazole (16 g, 16 cm^3 , 100 mmol) in anhydrous ether (100 cm^3) was then added by dropping funnel over 30 minutes. This was allowed to stir for 1 hour to give

a peach suspension. To this was added diethyl oxalate (16.3 cm³, 17.5 g, 120 mmol) rapidly to give a brown solution, resulting in a temperature increase to -30 °C. This was allowed to cool back to -78 °C and stirred for 30 minutes.

5 Reaction monitored by ¹H NMR (CDCl₃).

The brown solution was poured onto 5% hydrochloric acid solution (300 cm³) with vigorous stirring for 30 minutes.

Ether layer was separated and washed with saturated

bicarbonate (ca. 80 cm³), dried over magnesium sulphate, and

10 concentrated in vacuo to give an orange oil. This was purified by flash chromatography (10% ethyl acetate/hexane) to give a yellow oil (7.31 g, 39.47 mmol) [40% Yield].

Method OX-B

To a stirring solution of ethyl oxo-quinolin-8-yl-acetate (5.5 g, 24 mmol) in ethanol (140 mL) was added sodium acetate (2.16 g, 26.4 mmol) followed by hydroxylamine hydrochloride (2.67 g, 38.4 mmol). The mixture was heated to reflux; and, after 7 h, the heating mantle was removed and the solution was allowed to stir overnight at room temperature. To a stirred solution of Boc-R-(4-hydroxyphenyl)glycine methyl ester (19 g) in dichloromethane (400 mL) was added 2,6-lutidine (9.44 mL) and 4-dimethylaminopyridine (1.65 g) and
10 the mixture cooled in an ice bath. Trifluoromethanesulphonic anhydride (13.74 mL) was added over a period of 5 min, and then the reaction left to warm to room temperature over 4 h. The organic solution was washed with water (2 x 150 mL), 1 N HCl (2 x 150 mL), and then saturated sodium
15 bicarbonate (150 mL). The organics were dried with magnesium sulphate and then evaporated to an oil. The mixture was purified using flash chromatography (SiO₂ 250 g, eluting with 1:1 hexane/dichloromethane and then neat dichloromethane). Pure product fractions were combined and evaporated, finishing
20 with a high vacuum pump to remove all traces of solvent, to give a white solid, 19 g, 77%.

Boc-R-(4-Methoxycarbonylphenyl)glycine Methyl Ester.

Method PAE-D

Boc-R-4-trifluoromethanesulphonyloxyphenylglycine methyl ester (15 g), methanol (32.6 mL), bis-1,3-diphenyl-
30 phosphinylpropane (448 mg), palladium (II) acetate (255 mg), triethylamine (10.2 mL) and dimethylformamide (72 mL) were placed in the glass liner of pressure (Parr) reactor and the reactor assembled. The vessel was pressurised to ~0.68 bar

(10 psig) with nitrogen and the gas released (repeated five times to remove all oxygen from the system). Carbon monoxide gas was then carefully introduced (use extreme care -the gas cylinder is pressurised to far beyond the bursting disc

5 pressure of the Parr, ideally use a pressure regulator to reduce the pressure to ~ 6.8 bar, 100 psig) to ~1.4 bar (20 psig) and released three times (into the back of a fume hood).

Carbon monoxide was then added to ~6.8 bar (100 psig) and the stirrer started. The vessel was slowly heated to 65 °C

10 internal temperature and then stirred at 65 °C overnight. (At the early stages more carbon monoxide was added to maintain ~6.8 bar, 100 psig.) A sample was removed after 18 h and examined by tlc. When complete, the reaction was cooled to ~30 °C, the gas released and the vessel flushed five times

15 with nitrogen as before. The reaction mixture was partitioned between ethyl acetate and water, and the organic layer washed with 1 M hydrochloric acid and then saturated sodium bicarbonate. The solution was dried with MgSO₄ and evaporated. Flash chromatography of the resulting oil gave
20 the product, pure by tlc, 10.6 g, 90%.

30 General Experimental Procedures: Preparation of Inhibitors

Coupling Method A:

The coupling of an amine and carboxylic acid to form an amide. A solution of the amine (1 equiv) and carboxylic acid

(1.1 equiv) in a suitable solvent (DMF, and/or methylene chloride) is or was treated with diethyl cyanophosphonate (1.1 equiv) followed by addition of triethylamine or diisopropylethyl amine (0 to 3 equiv) to the mixture. After completion of the reaction by thin-layer chromatography, the mixture is or was partitioned between water and a suitable solvent (EtOAc, and/or methylene chloride) and washed with 1 N NaOH, water, brine, and concentrated. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

Coupling Method B:

The coupling of an amine and carboxylic acid to form an amide. A solution of the amine (1 equiv) and carboxylic acid (1.1 equiv) in a suitable solvent (DMF and/or methylene chloride) is or was treated with a carbodiimide-based dehydrating agent (e.g. DCC, or EDCI) (1.0 equiv). In general, addition of a benzotriazole-based reagent (e.g., HOBT or HOAT) (1 equiv) improves or improved reaction yields. After completion of the reaction by thin-layer chromatography, the mixture is or was partitioned between water and a suitable solvent (EtOAc and/or methylene chloride) and washed with 1 N NaOH, water, brine, and concentrated. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

Coupling Method C:

The coupling of an amine and acid chloride to form an amide. A solution of the amine (1 equiv) in an appropriate solvent (chloroform, and/or methylene chloride) and pyridine (1-10 equiv) is or was treated with an acid chloride (1.1 equiv). After completion of the reaction by thin-layer chromatography, the mixture is or was partitioned between a suitable solvent (EtOAc, methylene chloride, and/or

chloroform) and washed with 1 N NaOH, water, brine, and concentrated. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

5 Deprotection Method A:

A mixture of 10% palladium on carbon and the starting material in an appropriate solvent (EtOAc, EtOH, and/or HOAc) was placed under an atmosphere of hydrogen. Upon completion, the mixture was filtered and the filtrate concentrated. The
10 crude mixture was then purified, as indicated, or used directly in subsequent transformations.

Deprotection Method B:

A solution of the starting material in an appropriate
15 solvent (methylene chloride and/or chloroform) is or was treated with anisole (5-100 equiv) followed by trifluoroacetic acid (2-100 equiv). After completion of the reaction by thin-layer chromatography, the mixture is or was concentrated. The material either is or was partitioned between water and a
20 suitable solvent (EtOAc, methylene chloride, and/or chloroform) and washed with 1 N NaOH, water, brine, and concentrated, or is or was loaded onto an ion-exchange resin (SCX, Varian) and eluted with methanol followed by 2 N ammonia in methanol. Concentration of the later fractions affords or
25 afforded the free base product. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

Deprotection Method C:

30 A solution of the starting material in HOAc and HBr is or was heated at 70 °C. After 6-15 h, the mixture is or was cooled, concentrated, treated with 5 N NaOH until about pH 12, and the mixture is or was partitioned between EtOAc and water. The aqueous layer is or was washed with EtOAc (2-3x), the

organic layers are or were combined and washed with water, brine, and concentrated. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

5

Alkylation Method A:

A solution of the starting material (1 equiv) in 5-10% HOAc in methanol (anhydrous) is or was treated with the indicated aldehyde or ketone (2-10 equiv) followed by sodium cyanoborohydride (2-10 equiv). After completion, the mixture is or was concentrated and the residue either is or was partitioned between a suitable solvent (EtOAc, methylene chloride, and/or chloroform) and washed with 1 N NaOH, water, brine, and concentrated, or is or was directly loaded onto an ion-exchange resin (SCX, Varian) and eluted with methanol followed by 2 N ammonia in methanol. Concentration of the later fractions affords or afforded the free base product. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

20

Alkylation Method B:

A solution of the starting material (1 equiv) in methylene chloride is or was treated with the indicated aldehyde or ketone (2-10 equiv) followed by sodium triacetoxyborohydride (2-10 equiv). After completion, the mixture is or was concentrated and the residue is or was partitioned between a suitable solvent (EtOAc, methylene chloride, and/or chloroform) and washed with 1 N NaOH, water, brine, and concentrated. The material is or was dissolved in 5% HOAc in methanol and loaded onto an ion-exchange resin (SCX, Varian) and eluted with methanol followed by 2 N ammonia in methanol. Concentration of the later fractions affords or afforded the free base product. The crude mixture is or was then purified, as indicated, or used directly in subsequent transformations.

Preparation of Starting Materials

4-Isocyanomethyl-1-Boc-piperidine.

To a solution of 4-aminomethyl-1-Boc-piperidine (77.1 g, 20 360 mmol, 1 equiv) in 108 mL of methylene chloride at room temperature (rt) was added benzyltriethylammonium chloride (1.64 g, 72 mmol, 0.2 equiv) followed by 108 mL of a 50% sodium hydroxide solution. The reaction spontaneously achieved a mild reflux for 1.5 h and was allowed to stir for 25 an additional 12 h at rt. The reaction was diluted with H₂O and the product was extracted into methylene chloride. The organic layer was dried over anhydrous potassium carbonate, filtered, and concentrated. The crude residue was passed through a pad of silica gel with a 2:1 EtOAc:hexane solution. 30 Evaporation of the eluent provided 28.0 g (35%) the title compound.

Assay protocols

Enzyme Inhibition assays:

25

The ability of a test compound to inhibit factor Xa may be evaluated in one or more of the following Enzyme Inhibition assays, or in other standard assays known to those skilled in the art.

30

Enzyme Inhibition Assay 1

Enzyme assays were carried out at room temperature in 0.1M phosphate buffer, pH7.4 according to the method of Tapparelli

et al (J. Biol. Chem. 1993,268,4734-4741). Purified human factor Xa, trypsin, thrombin and plasmin were purchased from Alexis Corporation, Nottingham, UK. Urokinase was purchased from Calbiochem, Nottingham, UK. Chromogenic substrates for these enzymes; pefachrome-FXA, pefachrome-TRY, pefachrome-TH, pefachrome-PL and pefachrome-UK were purchased from Pentapharm AG, Basel, Switzerland. Product (*p*-nitroaniline) was quantified by adsorption at 405nm in 96 well microplates using a Dynatech MR5000 reader (Dynex Ltd, Billingshurst, UK). K_m and K_i were calculated using SAS PROC NLIN (SAS Institute, Cary, NC, USA, Release 6.11) K_m values were determined as 100.9 μ M for factor Xa/pefachrome-FXA and 81.6 μ M for trypsin/pefachrome-TRY. Inhibitor stock solutions were prepared at 40mM in Me2SO and tested at 500 μ M, 50 μ M and 5 μ M. Accuracy of K_i measurements was confirmed by comparison with K_i values of known inhibitors of factor Xa and trypsin.

In agreement with published data, benzamidine inhibited factor Xa, trypsin, thrombin, plasmin and urokinase with K_i values of 155 μ M, 21 μ M, 330nM, 200nM and 100nM respectively. NAPAP inhibited thrombin with a K_i value of 3nM. Compounds of the invention were found to have activity in these assays.

Enzyme Inhibition Assay 2

25

Human factor Xa and human thrombin were purchased from Enzyme Research Laboratories (South Bend, Indiana, USA). Other proteases were from other commercial sources. Chromogenic para-nitroanilide peptide protease substrates were purchased from Midwest Biotech (Fishers, Indiana, USA).

The binding affinities for human factor Xa were measured as apparent association constants (K_{ass}) derived from protease inhibition kinetics as described previously.^{a,b,c,d} The

apparent Kass values were obtained using automated (BioMek-1000) dilutions of inhibitors (Kass determinations are performed in triplicate at each of four-eight inhibitor concentrations) into 96-well plates and chromogenic substrate hydrolysis rates determined at 405 nm using a Thermomax plate reader from Molecular Devices (San Francisco). For factor Xa inhibition, the assay protocol was: 50 µl buffer (0.06 M tris, 0.3 M NaCl, pH 7.4); 25 µl inhibitor test solution (in MeOH); 25 µl human factor Xa (32 nM in 0.03 M tris, 0.15 M NaCl, 1 mg/ml HSA); finally, 150 µl BzIleGluGlyArgpNA (0.3 mM in water) added within 2 min to start hydrolysis. Final factor Xa was 3.2 nM. Free [Xa] and bound [Xa] were determined from linear standard curves on the same plate by use of SoftmaxPro software for each inhibitor concentration and apparent Kass calculated for each inhibitor concentration which produced hydrolysis inhibition between 20% and 80% of the control (3.2 nM factor Xa): $\text{apparent Kass} = [E:I] / [E_f][I_f] = [E_b] / [E_f][I^0 - I_b]$. The apparent Kass values so obtained are approximately the inverse of the K_i for the respective inhibitors [$1/\text{appKass} = \text{app } K_i$]. The variability of mean apparent Kass values determined at the single substrate concentration was +/- 15%. The assay system K_m was measured as 0.347 +/- 0.031 mM [n=4]; and V_{max} was 13.11 +/- 0.76 µM/min.

25

Kass values were determined with thrombin and other proteases using the same protocol with the following enzyme and substrate concentrations: thrombin 5.9 nM with 0.2 mM BzPheValArgpNA; XIa 1.2 nM with 0.4 mM pyroGluProArgpNA; XIIa 10 nM with 0.2 mM HDPropheArgpNA; plasmin 3.4 nM with 0.5 mM HDValLeuLyspNA; nt-PA 1.2 nM with 0.8 mM HDIleProArgpNA; and urokinase 0.4 nM with 0.4 mM pyroGluGlyArgpNA; aPC 3 nM with 0.174 mM pyroGluProArgpNA; plasma kallikrein 1.9 nM with D-

Derivatives. In press, J Med Chem (1999).

In general, the compounds of formula (I) exemplified herein
5 have been found to exhibit a K_i of 10 μM or less in Assay 1
and/or a K_{ass} of at least 0.1×10^6 L/mole in Assay 2.

The ability of a test compound to elongate Partial
Thromboplastin Time (Prothrombin Time) may be evaluated in the
10 following test protocols.

Partial Thromboplastin Time (Prothrombin) Test Protocol

Venous blood was collected into 3.2% (0.109m) trisodium
15 citrate vacutainer tubes at 1 volume of anticoagulant to nine
volumes of blood. The blood cells were separated by
centrifugation at 700g for ten minutes to yield plasma, which
was frozen at 70°C until required.

To perform the test, 100 μl of plasma was pipetted into in a
20 glass test tube, 1 μl of test compound in DMSO was added, and
allowed to warm to 37° over two minutes. 100 μl of warm (37°)
Manchester (tissue thromboplasin) reagent (Helena Biosciences,
UK) was added, allowed to equilibrate for two minutes. 100 μl
of warm (37°) 25mM calcium chloride solution was added to
25 initiate clotting. The test tube was tilted three times
through a 90° angle every five seconds to mix the reagents and
the time to clot formation recorded. Data from a series of
observations and test compound concentrations are analysed by
a SAS statistical analysis program and a CT2 (Concentration
30 required to double clotting time) for each compound is
generated.

Compounds of the invention were found to significantly elongate the partial thromboplastin time (Prothrombin time).

Coagulation Determinations. Prothrombin Times and APTT values were determined in HUMAN PLASMA with a STA instrument (Stago).

BioPT is a special non-plasma clotting assay triggered with human tissue factor (Innovin). Possible binding to albumen or
10 to lipid was assessed by comparing the BioPT effects in the presence/absence of 30 mg/ml human albumen (HSA) and 1 mg/ml phosphatidyl choline (PC). Inhibitors were delivered in 50% MeOH vehicle.
